

Portfolio Project Report

Introduction:

The general idea for my project is to build a website for rehoming pets. The inspiration for this comes from seeing my wife reaching out to friends on social media and **hoping** to rehome a second litter of kittens within a few months of each other. The website will provide an audience of people already interested in obtaining a new pet.

Expected List of Features:

The features that I expect my website to support are:

- Mobile friendly
- Bootstrap grid layout
- Navbar
- Cards
- Responsive images
- Collapse
- Tabs
- Carousel
- Tooltips
- Forms

These features will allow users to easily navigate through the website. A carousel as well as images will display various pets needing a new home. Utilizing tabs, collapse, and tooltips, information will be readily available for the user without cluttering the site with text everywhere. Forms will be useful in submitting pets for rehoming.

Market Survey:

There are several sites that offer rehoming. Adoptapet.com is a pet adoption website that focuses on finding homes for shelter and rescued animals. It also offers rehoming services. My website will be focused on the rehoming of pets. peterzippifund.org is more involved in animal rescue and spay/neuter assistance, as well as working with cats with special needs at shelters. They offer helpful information regarding caring for pets which I think would be great to include in my website as well. The website getyourpet.com has a search option that allows you to select different criteria for the type of pet you are looking for. I feel it is too extensive and narrowing down to a certain type of pet may cause someone to miss out on a great pet they might have not considered. I do like that they have a sign-in for anyone looking to rehome a pet and is a feature I might consider.
